

# PHARMACOLOGY ROULETTE!

You and your friends are test subjects for Big Pharma. There are six **experimental drugs** represented by dice (see table). Have lots of dice on-hand! Numbers rolled are **blood levels**.

**Turn Sequence:** Each player starts with one dose of fourazine. (Later turns may add meds.) Everyone rolls simultaneously (“Pill Time!”) and compares results to the blood levels table.

**Diagnosis:** Write down any odd results. Each time you roll that result again, either “add a med” or “boost a dose.”

- **Add a med:** Put a new die type into your mix.
- **Boost a dose:** Add a die type you already have in your pill mix.
- **Blood levels:** Count different drugs separately; add doses of the same drug. *Example:* Jen rolls a 5 total on two doses of fourazine and gets Joint Pain; Les rolls a single dose of fourazine and of pralosis for a 4 and a 1 and gets Depression.

**Winning!** Play until someone dies. The surviving player with the lowest current blood level on their largest die type wins!

# EXPERIMENTAL MEDICINE

fourazine (d4)

adiveight (d8)

dodecarol (d12)

pralosisix (d6)

lipaten (d10)

icosagen (d20)

## BLOOD LEVELS

1	Depression	8	<i>Happy Days!</i>
---	------------	---	--------------------

2	<i>Feelin' good!</i>	9	Seizures
---	----------------------	---	----------
